INSTRUCTIONS:

1. This examination consists of a total of 9 different pages. The last three pages include a periodic table, some useful mathematical equations, a solubility table and a table of equilibrium constants. All work should be done in this booklet.

2. PRINT your name, TA’s name and your lab section number now in the space at the top of this sheet. DO NOT SEPARATE THESE PAGES.

3. Answer all questions that you can and whenever called for show your work clearly. Your method of solving problems should pattern the approach used in lecture. You do not have to show your work for the multiple choice or short answer questions.

4. No credit will be awarded if your work is not shown in problems 3, 5, 6b and 7.

5. Point values are shown next to the problem number.

6. Budget your time for each of the questions. Some problems may have a low point value yet be very challenging. If you do not recognize the solution to a question quickly, skip it, and return to the question after completing the easier problems.

7. Look through the exam before beginning; plan your work; then begin.

8. Relax and do well.

1. Write the chemical formula(s) of the product(s) and balance the following reactions. Identify all products phases as either (g)as, (l)iquid, (s)olid or (a)queous. Soluble ionic compounds should be written in the form of their component ions.

a) \( \text{HI}^{(aq)} + \text{RbOH}^{(aq)} \rightarrow \text{H}_2\text{O}^{(l)} + \text{Rb}^+(aq) + \text{I}^-\text{(aq)} \)

b) \( 3\text{Na}_2\text{S}^{(aq)} + 2\text{Fe(NO}_3\text{)}_3(aq) \rightarrow \text{Fe}_2\text{S}_3(s) + 6\text{Na}^+(aq) + 6\text{NO}_3^-\text{(aq)} \)

c) \( \text{C}_6\text{H}_5\text{NH}_2^{(aq)} + \text{HCN}^{(aq)} \rightarrow \text{C}_6\text{H}_5\text{NH}_3^+(aq) + \text{CN}^-\text{(aq)} \)

2. Write the ionic and net ionic chemical equations for 1a).

1a) Ionic equation:
\[
\text{H}^+(aq) + \text{I}^-(aq) + \text{Rb}^+(aq) + \text{OH}^-\text{(aq)} \rightarrow \text{H}_2\text{O}(l) + \text{Rb}^+(aq) + \text{I}^-\text{(aq)}
\]

Net Ionic equation:
\[
\text{H}^+(aq) + \text{OH}^-\text{(aq)} \rightarrow \text{H}_2\text{O}(l)
\]

3. Give the name or draw the Lewis structure for each of the following compounds.

- **trans-3-heptene**
- **4,5-dimethyl-2-hexyne**
- **2,3-dimethyl-2-butene**
4. When $H_2(g)$ is mixed with $CO_2(g)$ at 2000 K, the equilibrium is achieved according to the equation below,

$$H_2(g) + CO_2(g) \rightarrow H_2O(g) + CO(g)$$

In one experiment, the following equilibrium concentrations were measured;

- $[H_2] = 0.150$ M
- $[CO_2] = 0.400$ M
- $[H_2O] = [CO] = 0.550$ M

a) Calculate the value of $K_c$, the equilibrium constant for the reaction.

$$K_c = \frac{[H_2O][CO]}{[H_2][CO_2]} = \frac{(0.550)(0.550)}{(0.150)(0.400)} = 5.04$$

b) In a different experiment, 0.75 mol $H_2(g)$ is mixed with 0.75 mol of $CO_2(g)$ in a 3.00 liter reaction vessel at 2000 K. Calculate the equilibrium concentrations, in moles per liter of all species at this temperature.

$$\frac{0.75 \text{ mol}}{3.0 \text{ L}} = 0.25 \text{ M}$$

<table>
<thead>
<tr>
<th></th>
<th>$CO_2$</th>
<th>$H_2$</th>
<th>$H_2O$</th>
<th>$CO$</th>
</tr>
</thead>
<tbody>
<tr>
<td>initial</td>
<td>0.25 M</td>
<td>0.25 M</td>
<td>0</td>
<td>0</td>
</tr>
<tr>
<td>change</td>
<td>-x</td>
<td>-x</td>
<td>+x</td>
<td>+x</td>
</tr>
<tr>
<td>final</td>
<td>0.25-x</td>
<td>0.25-x</td>
<td>0+x</td>
<td>0+x</td>
</tr>
</tbody>
</table>

$$K_c = \frac{[H_2O][CO]}{[H_2][CO_2]} = 5.04$$

$$5.04 = \frac{x^2}{(0.25 - x)^2}$$

taking the square root of both sides

$$2.24 = \frac{x}{0.25 - x}$$

solving for $x$

$$x = 0.173 \text{ M}$$

- $[H_2O] = [CO] = x = 0.173$ M
- $[H_2] = [CO_2] = 0.25 - 0.173 \text{ M} = 0.077$ M
(30) 5. Calculate the pH for each of the following solution;

a) 0.00360 M Ba(OH)\textsubscript{2}

\[
\text{Ba(OH)}_2 \rightarrow \text{Ba}^{2+} + 2\text{OH}^- \\
\begin{array}{c|c|c}
\text{I} & 0.0036 & 0 \\
\text{F} & 0 & 0.0036 \\
\hline
\end{array}
\]

NaOH is a strong base and completely dissociates in water.
Therefore,
\[\text{[OH}^-\text{]} = 0.0072 \text{ M and pOH} = 2.14, \text{pH} = 11.86\]

b) 0.750 M HC\textsubscript{3}H\textsubscript{5}O\textsubscript{2} (propionic acid)

\[
\text{HC}_3\text{H}_5\text{O}_2 \rightleftharpoons \text{H}^+ + \text{C}_3\text{H}_5\text{O}_2^- \\
\begin{array}{c|c|c}
\text{I} & 0.750 & 0 \\
\text{C} & -x & +x \\
\text{E} & 0.750 - x & x \\
\hline
\end{array}
\]

\[K_a = \frac{[\text{H}^+][\text{C}_3\text{H}_5\text{O}_2^-]}{[\text{HC}_3\text{H}_5\text{O}_2]} = 1.3 \times 10^{-5}\]

\[1.3 \times 10^{-5} = \frac{(x)(x)}{(0.750 - x)}\]

Assume 0.750 – x = 0.750

\[1.3 \times 10^{-5} = \frac{x^2}{0.750} = x^2 = 0.750\]

\[x = 0.0031 \text{ M} = [\text{H}^+] : \text{pH} = 2.51\]

c) 0.218 M (CH\textsubscript{3})\textsubscript{3}N

\[
(\text{CH}_3)_3\text{N} + \text{H}_2\text{O} \rightleftharpoons (\text{CH}_3)_3\text{NH}^+(aq) + \text{OH}^-(aq) \\
\begin{array}{c|c|c}
\text{I} & 0.218 & 0 \\
\text{C} & -x & +x \\
\text{E} & 0.218 - x & x \\
\hline
\end{array}
\]

\[K_b = \frac{[(\text{CH}_3)_3\text{NH}^+][\text{OH}^-]}{[(\text{CH}_3)_3\text{N}]} \]

\[6.4 \times 10^{-5} = \frac{(x)(x)}{0.218 - x} \quad \text{assume } x \ll 0.218\]

\[6.4 \times 10^{-5} = \frac{x^2}{0.218} \]

\[3.7 \times 10^{-3} \text{ M} = x = [\text{OH}^-] \]

\[\text{pOH} = 2.43, \quad \text{pH} = 11.57\]
Short Answer: Parts a – d are worth 4 points, part e is worth 6 points and part f is worth 9 points.

(20) 6a. Identify the acid, base, conjugate acid and conjugate base in the following chemical equation,

\[
\text{HPO}_4^{2-}(\text{aq}) + \text{HC}_2\text{H}_3\text{O}_2(\text{aq}) \rightarrow \text{H}_2\text{PO}_4^{-}(\text{aq}) + \text{C}_2\text{H}_3\text{O}_2^{-}(\text{aq})
\]

base acid conjugate acid conjugate base

b) K for the reaction in 6a above has a value of 290. Identify the stronger acid and base in the reaction.

acid \(\text{HC}_2\text{H}_3\text{O}_2\) base \(\text{HPO}_4^{2-}\)

c) The pH of a \(5.50 \times 10^{-4}\) M \(\text{HClO}_3\) solution is about 3.30. Is \(\text{HClO}_3\) a strong acid or a weak acid? Explain.

For a pH of 3.30 the \([\text{H}^+] = 5.01 \times 10^{-4}\). The concentration of \([\text{H}^+]\) is nearly the same as the initial concentration of \(\text{HClO}_3\). The percent ionization is;

\[
\frac{5.01 \times 10^{-4}}{5.50 \times 10^{-4}} \times 100 = 91\%
\]

So nearly all of the has \(\text{HClO}_3\) dissociated, so \(\text{HClO}_3\) is a strong acid.

d) Identify the chemical specie(s) in the highest concentration in 6c. (Note: excluding water.)

\([\text{H}^+]\) and \([\text{ClO}_3^-]\) are at the largest concentrations in the solution.

e) Identify each of the following substances as an acid or a base and write a chemical equation that describes the acid or base character.

i) \((\text{CH}_3)_2\text{NH}_2^+(\text{aq})\)

\((\text{CH}_3)_2\text{NH}_2^+(\text{aq}) \rightleftharpoons \text{H}^+(\text{aq}) + \text{(CH}_3)_2\text{NH}(\text{aq})\)

acid

ii) \(\text{C}_4\text{H}_7\text{O}_2^-\) (aq)

\(\text{C}_4\text{H}_7\text{O}_2^-\)(aq) + \(\text{H}_2\text{O}(\text{aq}) \rightleftharpoons \text{HC}_4\text{H}_7\text{O}_2(\text{aq}) + \text{OH}^-\)(aq)

base
f) \( K_p \) is 2.00 at a certain temperature for the reaction below

\[
2\text{NO}(g) + \text{O}_2(g) \rightleftharpoons 2\text{NO}_2(g)
\]

The reaction mixture initially contains 1 atm of each compound in the equation, and then is allowed to proceed towards equilibrium.

i) Will the total pressure of the reaction system increase, decrease or stay the same? Explain.

\[
Q = \frac{P_{\text{NO}_2}^2}{P_{\text{NO}}^2 \cdot P_{\text{O}_2}} = \frac{1^2}{1^2 \cdot 1} = 1
\]

\( Q = 1 \), therefore the reaction must go from left to right to establish equilibrium. Since there are fewer moles of product the total pressure will decrease.

ii) Will \( P_{\text{NO}} = P_{\text{O}_2} \) when equilibrium is established? Explain.

\( \text{No, twice as much NO reacts as O}_2 \) so the \( P_{\text{NO}} < P_{\text{O}_2} \) at equilibrium.

iii) The reaction between \( \text{NO}(g) \) and \( \text{O}_2(g) \) is exothermic. What will happen to the magnitude of \( K \) if the temperature of the reaction is increased? Explain

\( K \) will decrease. The reaction will shift from right to left to relieve the stress of adding heat. So the amount of reactants increase and the amount of products decrease and \( K \) gets smaller.
